How is the investigational medication administered?
The investigational study medication is taken daily by mouth. The methotrexate study medication is taken weekly by mouth.

Will it cost anything to participate?
It does not cost anything to enroll in the SOAR study. For study participants, all investigational medication, study related procedures and study doctor’s visits will be provided at no cost to you for the duration of the study. Qualified participants may receive reimbursement for travel and study-related expenses.

What can I expect if I participate in a clinical study?
An informed consent document will be given to you that includes information about the clinical study, as well as potential benefits and possible risks associated with the research. An independent ethics group will review the study periodically. You will also be monitored by the research team to assess your health and well-being. You are free to leave the clinical study at any time.

You should carefully consider and talk with your doctors and family about both the potential benefits and risks of participation before enrolling in a clinical study.

Consider participating in the Soar Study
Take the first step.

Are you living with stiff, painful joints?

Join a Clinical Study investigating Rheumatoid Arthritis (RA) medications
About this clinical research study

The objective of this study is to evaluate the safety and effectiveness of the investigational study medication with or without methotrexate.

Who is eligible to participate?

The study requires adult subjects who:
- Are 18 years of age or older,
- Have been diagnosed with moderate to severe rheumatoid arthritis,
- Are currently taking methotrexate,
- Are not adequately responding to current treatment,
- Are willing to follow the study treatment, and routine scheduled visits for study-related procedures for up to one year.

What will happen during this study?

If you are eligible to participate in this study, you will attend a screening visit, up to six study visits, and a telephone follow-up visit.
- At each visit you will have a physical assessment, medication review, be given the opportunity to report any adverse events, and receive the investigational study medication.
- Blood and urine samples will be collected for laboratory analysis during certain visits.
- You will receive study-related medical care throughout the study.

What is rheumatoid arthritis?

Most people with rheumatoid arthritis (RA) experience intermittent bouts of intense disease activity, called flare-ups. In some people the disease is continuously active and gets worse over time. Others enjoy long periods of remission—no disease activity or symptoms at all. Early diagnosis and aggressive treatment can put the disease into remission, which is the best way of avoiding joint destruction, organ damage, and disability.

RA is chronic, which means it cannot be cured. It usually affects the small joints in hands and feet and causes inflammation throughout the body that primarily affects the lining of the joints and causes painful swelling. The result of an attack causes fluid buildup in the joints that can lead to bone breakdown and joint deformity.

RA is a life-long disease that usually requires life-long treatment, including medication, physical therapy, exercise, and education. Without adequate treatment, RA causes substantial disability and a significant impact on health status and quality of life.

If you are currently taking methotrexate for your rheumatoid arthritis and still having pain, you may consider participating in this clinical research study:
A3921192 – A Clinical Study for Moderate to Severe Rheumatoid Arthritis.
