Real-world studies of palbociclib plus hormonal therapy for men with advanced breast cancer

The full title of this abstract is: View ASCO 2017 plus hormonal therapy for men with Real-world evidence of male breast cancer (BC) patients treated with palbociclib

What did these studies look at?

- Palbociclib
- Hormonal therapy
- Advanced breast cancer
- HR+/HER2− advanced or metastatic breast cancer
- Hormonal receptor-positive (HR+)/human epidermal growth factor receptor 2-negative (HER2−) advanced or metastatic breast cancer

Who took part in these studies?

Study 1
- 1 in 10 men (147 men) had received palbociclib + hormonal therapy.
- 81/2 months of treatment,
- 37 men.
- Around 41/2 months of treatment.

Study 2
- 12 men received palbociclib + hormonal therapy and 8 men only received hormonal therapy.
- 8 men received hormonal therapy alone.
- 4 of the 12 men who took palbociclib + hormonal therapy responded to the treatment.
- Men who only received hormonal therapy had around 41/2 months of treatment. Men who only received hormonal therapy had around 41/2 months of treatment.

What were the results of the studies?

Study 1
- 41/2 months of treatment
- Around 41/2 months of treatment
- Around 41/2 months of treatment
- Around 41/2 months of treatment
- Around 41/2 months of treatment

Study 2
- 8 men only received hormonal therapy
- 8 men only received hormonal therapy
- Around 41/2 months of treatment
- Around 41/2 months of treatment
- Around 41/2 months of treatment

What were the main conclusions reported by the researchers?

In real-world studies, people receive treatments in their normal clinical setting. This type of study helps researchers to do clinical trials. Breast cancer is rare in men, so it is difficult for researchers to do clinical trials.

Who sponsored this study?

Envision Pharma Group, Inc. and was funded by Pfizer.
